

Development of functional microsatellite markers from the Antarctic fur seal transcriptome assembly

Supplementary of: ‘Heterozygosity at neutral and immune loci does not influence neonatal mortality due to microbial infection in Antarctic fur seals’

Vivienne Litzke, Meinolf Ottensmann, Jaume Forcada & Joseph I. Hoffman

Preface

This document provides all details on the development of functional microsatellites with relation to immune genes in Antarctic fur seals. Both the Rmarkdown file and the data can be downloaded from the accompanying GitHub repository on ([URL TO GITHUB](#)) as a zip archive containing all the files. Note, a suite of R packages, perl scripts as well as the assembled *Arctocephalus gazella* transcriptome may be downloaded as shown below in order to repeat analyses shown here.

We recommend to download or clone this GitHub repository in order to access the documentation together with all files that are needed to repeat analyses shown in this document. Just click on the link above and then on the green box **Clone or download**. In order to function properly, the same structure of folders must be kept. If you have any questions, don't hesitate contacting me: [meinolf.ottensmann\[at\]web.de](mailto:meinolf.ottensmann[at]web.de)

- If you have downloaded the project from github then you will see that:
- Raw data required are within the folder **data/**
- The *Arctocephalus gazella* transcriptome¹ may be downloaded here and saved as **arc_gaz_transcriptome.fasta** in **data**.
- This pipeline invokes the **MIcroSAtellite identification** tool for primer identification. Click on this link for details and how to install it: [MISA](#)².
- Primer development was conducted using primer3³.
- Additionally, the R packages listed below are required and may be installed on your system if not available.

```
install.packages("dplyr")
install.packages("knitr")
install.packages("magrittr")
```

```
library(magrittr)
```

Identifying microsatellites within the transcriptome

Short tandem repeats were identified within the Antarctic fur seal transcriptome assembly using the script `misa.pl`. The required initiation file called `misa.ini` is available in the folder `data` and defines the minimum number of five repeats for di-, tri- and tetranucleotide motifs. *As already mentioned before, MISA needs to be downloaded by the user*

```
# identify microsats
perl misa.pl arc_gaz_transcriptome.fasta
```

The code above generates one output file `arc_gaz_transcriptome.fasta.misa` containing a total of 2578 microsatellites found within the transcriptome. The resulting data table is subsequently reformatted for further filtering steps.

```
# read the data
data <- readLines("data/arc_gaz_transcriptome.fasta.misa")

# create a matrix
microsats_table <- matrix(ncol = length(strsplit(data[1], split = "\\t")[[1]]),
                          nrow = length(data))
for (i in 1:length(data)) {
  microsats_table[i,1:length(strsplit(data[i], split = "\\t")[[1]])] <-
    strsplit(data[i], split = "\\t")[[1]]
}
microsats_table <- as.data.frame(microsats_table[2:nrow(microsats_table),])

# add column names
names(microsats_table) <-
  c('contig.name', 'ssr.no', 'ssr.type', 'ssr.seq', 'ssr.size', 'ssr.start', 'ssr.end')

# read contig length information
contig_length <- read.table("data/transcriptlength.txt", header = T)
names(contig_length) <- c('MatchID', 'contig.length')

# set to character
microsats_table[["contig.name"]] <-
  as.character(microsats_table[["contig.name"]])
contig_length[["MatchID"]] <-
  as.character(contig_length[["MatchID"]])

# correct 'MatchID' for cross-referencing
microsats_table[["MatchID"]] <- NA
for (i in 1:nrow(microsats_table)) {
  # discard chunk following the underscore (e.g. 4708387_length... becomes 4708387)
  microsats_table$MatchID[i] <-
    strsplit(microsats_table$contig.name[i], split = "_")[[1]][1]
  microsats_table$MatchID[i] <-
    strsplit(microsats_table$MatchID[i], split = " ")[[1]][1]
}

# correct contig_length
for (i in 1:nrow(contig_length)) {
  # remove everything after the underscore, see above
  contig_length$MatchID[i] <-
    strsplit(contig_length$MatchID[i], split = "_")[[1]][1]
```

```

}

# merge data frames
microsats_table <-
dplyr::left_join(microsats_table, contig_length, by = "MatchID")

# some data class conversions
microsats_table[["ssr.start"]] <-
  as.numeric(as.character(microsats_table[["ssr.start"]]))
microsats_table[["ssr.end"]] <-
  as.numeric(as.character(microsats_table[["ssr.end"]]))
microsats_table[["contig.length"]] <-
  as.numeric(as.character(microsats_table[["contig.length"]]))

```

Filtering Microsatellites

Among the 2577 identified microsatellites there are some compound microsatellites as well as repeats that do not offer adequate flanking sites for primer design. These are discarded.

```
# remove compound microsats
microsats_table <-
  subset(microsats_table, microsats_table[["ssr.type"]] != 'c')
microsats_table <-
  subset(microsats_table, microsats_table[["ssr.type"]] != 'c*')

# selection based on flanking sites
microsats_table[["temp"]] <-
  rep(1,nrow(microsats_table)) # flag for removal
for (i in 1:nrow(microsats_table)) {
  # inspect flanking site upstream
  if (microsats_table[["ssr.start"]][i] <= 100) {
    microsats_table[["temp"]][i] <- 0
    # inspect flanking site downstream
  } else if ((microsats_table[["contig.length"]][i] -
    microsats_table[["ssr.end"]][i]) <= 100) {
    microsats_table[["temp"]][i] <- 0
  }
}

# Remove flagged microsats
microsats_table <- subset(microsats_table, microsats_table[["temp"]] != 0)
microsats_table <- microsats_table[,1:9]
```

After the above filtering 1580 microsatellites are retained. Now, we select microsatellites that are associated to immunity based on Gene Ontology Gene annotations.

```
# Keywords including 'immune*'
annotation <- readLines("data/arc_gaz_transcriptome_annotations.txt")
annotations <- matrix(ncol = 18, nrow = length(annotation))

# fill table
for (i in 1:nrow(annotations)) {
  annotations[i, 1:length(strsplit(annotation[i], split = "\t")[[1]])] <-
    strsplit(annotation[i], split = "\t")[[1]]
}
annotations <- data.frame(annotations)[-1,]
annotations <- annotations[, c(1,14:18)]
names(annotations) <- c('MatchID','goTerm','cellular.components','biological.processes',
  'molecular.functions','keywords')

annotations[["MatchID"]] <- as.character(annotations[["MatchID"]])
for (i in 1:nrow(annotations)) {
  annotations[["MatchID"]][i] <-
    strsplit(annotations[["MatchID"]][i],split = "_")[[1]][1]
}

annotations.extd <- dplyr::left_join(microsats_table, annotations,by = 'MatchID')

immuneTable2 <- data.frame(annotations.extd) %>% # Check for matches with keywords
```

```

dplyr::filter(grepl('immun*', keywords))

ImmuneMarker_Keywords <- immuneTable2 # 13 within just keywords

For 13 microsatellites there is a match to the term 'immun*' within the keywords of the GO annotations.
To increase the number of suitable microsatellites we repeat the initial search to all categories of the GO
annotations with an extended list of search terms shown below.

# define list of keywords
immune <- c('immun*',
            'antigen',
            'chemokine',
            'T cell',
            'MHC',
            'Antibody',
            'histocompatibility',
            'Interleukin',
            'Leucocyte',
            'Lymphocyte')

immuneLines <- NULL
for (i in immune) {
  immuneLines <- c(immuneLines, annotation[grepl(i, annotation, ignore.case = T)])
}

immuneTable <- matrix(ncol = 18, nrow = length(immuneLines))

for (i in 1:length(immuneLines)) {
  immuneTable[i,1:length(strsplit(immuneLines[i], split = "\t")[[1]])] <-
    strsplit(immuneLines[i], split = "\t")[[1]]
}
immuneTable <- data.frame(immuneTable)[,c(1,10,14:18)]
names(immuneTable) <-
  c('MatchID', 'geneID', 'goTerm', 'cellular.components', 'biological.processes',
    'molecular.functions', 'keywords')

immuneTable[["MatchID"]] <-
  as.character(immuneTable[["MatchID"]])
for (i in 1:nrow(immuneTable)) {
  immuneTable[["MatchID"]][i] <-
    strsplit(immuneTable[["MatchID"]][i], split = "_")[[1]][1]
}

ImmuneMarker_whole_file <-
  unique(dplyr::inner_join(microsats_table, immuneTable, by = "MatchID"))

# write to file
write.csv2(ImmuneMarker_whole_file, file = "data/immune_microsats_raw.csv", row.names = F)

```

The extended search yielded a total of 137 microsatellites. The entire list is shown below.

Designing primers

For all of the 137 we developed oligonucleotide primers using the primer design tool primer3. In order to use the command line interface, the list list of microsatellites may be re-formatted accordingly.

```
# list of microsatellites
data <- read.csv(file = "data/immune_microsats_raw.csv", sep = ';')[,1:7]
names(data) <- c('ID','SSR nr.','SSR type','SSR','size','start','end')
data[["ID"]] <- as.character(data[["ID"]])

for (i in 1:nrow(data)) {
  if ((nchar(data[["ID"]][i]) > 20)) {
    data[["ID"]][i] <-
      paste0(strsplit(data[["ID"]][i],split = "_")[[1]][1]," ",
             strsplit(data[["ID"]][i],split = "_")[[1]][2]," ",
             strsplit(data[["ID"]][i],split = "_")[[1]][3]," ",
             strsplit(data[["ID"]][i],split = "_")[[1]][4],"_",
             strsplit(data[["ID"]][i],split = "_")[[1]][5],"_",
             strsplit(data[["ID"]][i],split = "_")[[1]][6],"_",
             strsplit(data[["ID"]][i],split = "_")[[1]][7])
  }
}
write.table(row.names = FALSE, quote = FALSE,x = data,
            sep = "\t",file = 'data/arc_gaz_transcriptome.fasta.misa2')
```

Invoke primer3 for primer design

```
perl p3_in_fur_seal.pl arc_gaz_transcriptome.fasta.misa2
primer3_core <arc_gaz_transcriptome.fasta.p3in> arc_gaz_transcriptome.fasta.p3out
```

Overview of initially tested microsatellites

The table below summarises the results of testing 96 primers on 12 Antarctic fur seal individuals. See the manuscript for further details.

Table 3: Overview microsatellite testing
